Background

Little Green Button is a panic alarm system—a discreet on-screen button used by organisations to help staff quickly call for assistance during an emergency.

To raise an alert simply double-click a small green icon on their computer or mobile device. It's designed for public-facing environments such as GP surgeries.

In practice this is used when there is a medical emergency in any room and help is summoned. The button will say which area/room needs assistance.

Procedure

How It Works

- **Green button showing on EMIS** → system is connected
- **Double-click** → alert is raised
- **Button turns red** → colleagues are alerted
- **Yellow** → help is on the way (someone has acknowledged your alert)

On occasion this button is missing and needs to be manually installed.

1. If it does not open automatically, search for **Little Green Button** in the Windows search bar and open it manually. Open the **Windows search bar** and type **Software Centre**.
2. Select and open **Software Centre**.
3. Navigate to the **Applications** tab.
4. Locate and select **Little Green Button**.
5. Click **Install**.

You may be prompted to select your location on first launch. Once completed, the application will be ready to use
